

# HealthKit Feedback

With the release of iOS 8 and Healthkit I've seen one part of that API brought up more times than anything else: the definition of "biological sex".

```
typedef enum : NSInteger {
    HKBiologicalSexNotSet = 0,
    HKBiologicalSexFemale ,
    HKBiologicalSexMale ,
} HKBiologicalSex;

enum HKBiologicalSex : Int {
    case NotSet
    case Female
    case Male
}

Constants
    HKBiologicalSexNotSet / NotSet
        A constant indicating that either the user's biological sex is
        the user has not granted your app permission to read the biolog

    HKBiologicalSexFemale / Female
        A constant indicating that the user is female.

    HKBiologicalSexMale / Male
        A constant indicating that the user is male.
```

The given documentation and usage is awkward and not inclusive. I've talked with a few people and formulated two bug reporter templates that should help start a conversation about getting this addressed.

###1. "What should the term 'Biological Sex' be replaced with?"

The phrase "biological sex" implies a simplistic understanding of sex, as well as a strict binary applying to both sex and gender. It reinforces the belief that the gender identities of trans people are somehow not "Real", and centers a notion of "sex" that privileges a specific trait or combination of traits (such as chromosomes or genitalia) over identity and lived experience. The reality is that "biological sex" as a taxonomy is nowhere near as binary, or as definitive, as it is made out to be. Without even touching on the complex interplay between sex and gender, we have to consider that an estimated 1 in 10,000 people have an intersex condition -- that's at least 31,000 people in the United States alone.

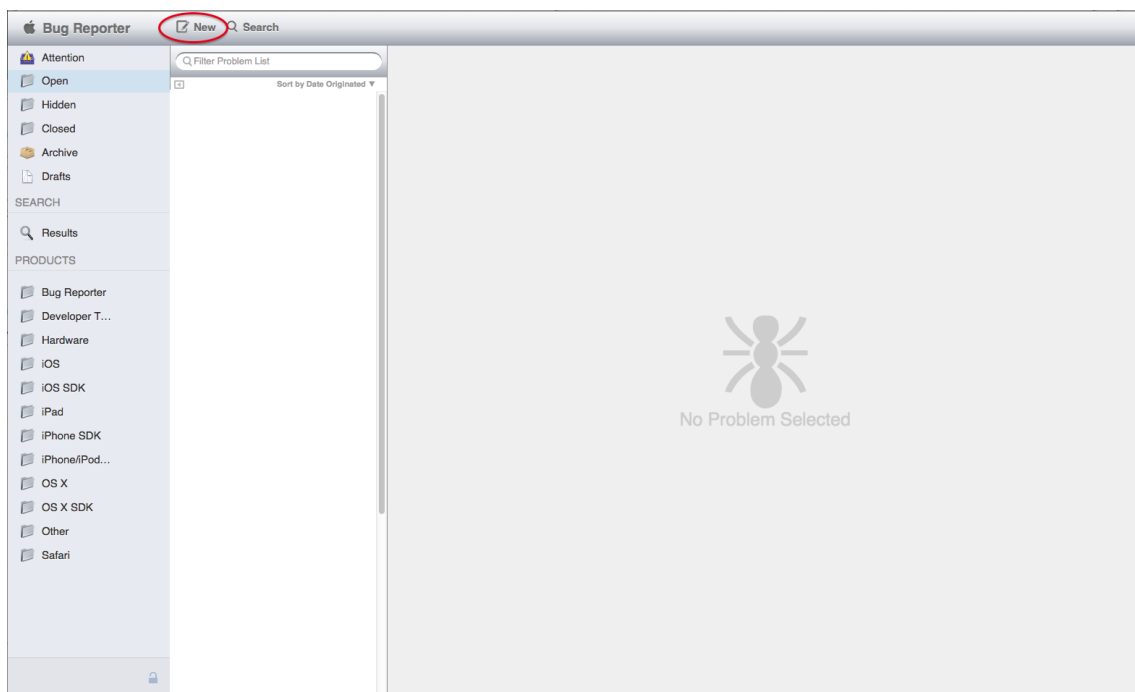

The stated rationale behind this as being for "medical purposes" ignores that what most commonly distinguishes between a man and woman's health is androgens versus estrogens -- and that there is a complex interplay of factors involved in even determining someone's "sex" for medical purposes. Therefore, what purpose is served in trying to reinforce an already simplistic understanding of "biological sex" -- one that is consistently used to misgender trans folk, and actually ignores why it's even being asked in the first place? It would be far better to ask about specific health factors, such as the presence/absence of estrogen and the possibility of pregnancy.

###2. "What would be the best way to include non-binary options in the API?"

Simply put, how can we better represent the non-binary options based on the conversation started from the first question. Are options even required here if the usage of "biological sex" is no longer necessary to describe the intended data?

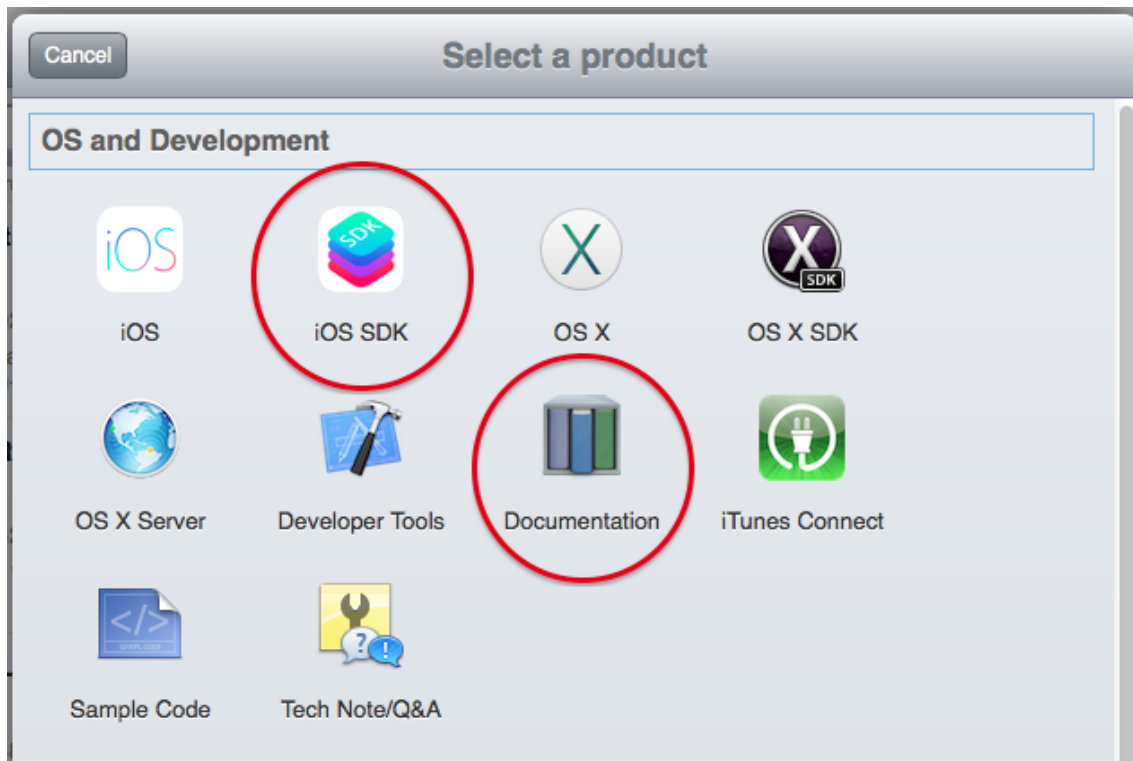

###How to give feedback

Visit <https://bugreport.apple.com> and sign in with an Apple ID<sup>1</sup>. Once logged in, click on the button in the upper left marked "New".

####Filing feedback for "What should the term 'Biological Sex' be replaced with?":

- Feedback on the first question should be categorized as "iOS SDK" or "Documentation"

- "Classification" of the report should be marked as "Enhancement"
- "Reproducibility" should be marked as "Not Applicable"
- Title should start with "HealthKit API | Biological Sex Feedback" or "HealthKit Documentation | Biological Sex Feedback" as applicable to the filing being about the SDK or Documentation respectively.

Please include only one issue per report. All fields are **required** except where noted. While we cannot respond directly to every report, all reports are reviewed by the appropriate engineering teams.

**Classification\***    Select a type of problem

**Reproducibility\***    Select how often this problem occurs

[Show instructions for gathering logs](#)

Attach a file

**Title:** Provide a short but descriptive sentence that summarizes the issue

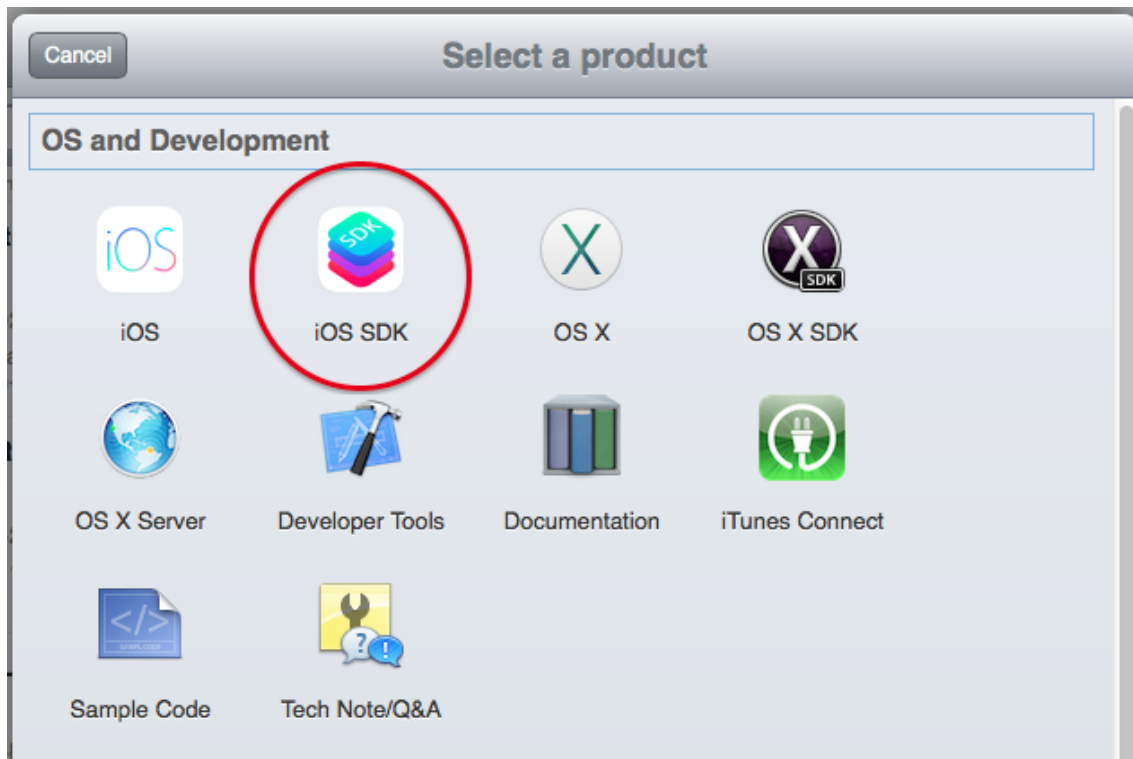

Enter a brief and clear title that expresses the problem.

**Description:** Provide a detailed description about the issue and include specific details to help the engineering team understand the problem

Provide a descriptive summary of the issue.

#####Filing feedback for "What would be the best way to include non-binary options in the API?":

- Feedback on the first question should be categorized as "iOS SDK"

- "Classification" of the report should be marked as "Feature (New)"
- "Reproducibility" should be marked as "Not Applicable"
- Title should start with "HealthKit API | Biological Sex Feedback"

[Using Apple Bug Reporter](#)

Please include only one issue per report. All fields are **required** except where noted. While we cannot respond directly to every report, all reports are reviewed by the appropriate engineering teams.

**Classification\***    Select a type of problem

**Reproducibility\***    Select how often this problem occurs

**Title:** Provide a short but descriptive sentence that summarizes the issue

Enter a brief and clear title that expresses the problem.

**Description:** Provide a detailed description about the issue and include specific details to help the engineering team understand the problem

Provide a descriptive summary of the issue.

The rest of the form can be filled out as you see fit. There are many "required" fields that aren't applicable to filing feedback, to those you can put in "N/A" or "Not Applicable" or continue to use them if you need the extra space to give the feedback necessary.
